U.S.P. A. VLARGER SUPPLIES OF MEAT AVAILABLE FOR COMMUNICATION IN SUPPLIED COUNTRIES DURING 1952 1/

The total supplies of rest available for consumption in specified countries 2/ during 1952 exceeded 1951 by about 4 percent and the 1946-50 average by 11 percent. Since the population increases from 1 to 3 percent annually in this group of countries the 1952 supplies represent a per capita consumption 4 percent larger than 1951 and equal to or slightly greater than the 1946-50 level.

Meat Supplies by Areas

In North America the 1952 supplies of meat due to an increase in both production and net imports were 6 percent greater than 1951 and 4 percent larger than the 1946-50 level. Even though the depend for meat has been relatively strong, especially in the United States, the increase in supplies for recent years has been below population (ains. The per capita consumption for this area during 1952 was about 5 percent below the 1946-50 level. During 1952 the per capita consumption ranged from 59 pounds in Texico to 144 pounds in the United States.

In the European countries the 1953 supplies of meat exceeded 1951 by 6 percent and the 1946-50 average by 20 percent. These larger supplies have resulted from substantial increases in production above the early postwar low. The large increase in production was partially effect by an appreciable decline in net imports. However, per-capita consumption in Europe during 1952 was probably 4 percent greater than 1951 and more than 10 percent greater than the 1946-50 average. During 1952 the per capita consumption by countries in this area ranged from 25 pounds in Greece to 108 pounds in Denmark.

In the South American countries the 1952 consumption of meat exceeded 1951 by 5 percent and the 1946-50 average by 12 percent. These increases may be attributed to a substantial decline in exportable surpluses from the argentine and a corresponding increase in domestic consumption

^{1/ ..} summary of this information was published in the August 31, 1953 issue of Foreign Crops and Parkets. 2/ See table for countries included.

August, 1953

accompanied by appreciable increases in meat production in Brazil and Uruguay. Per capita consumption in these countries during 1952, ranging from 57 pounds in Brazil to 243 pounds in Uruguay, possibly averaged 5 percent above the 1946-50 level.

In <u>Oceania</u> the supplies of meat channeled into domestic outlets during recent years have been about equal to gainsin population. Additional increases in production have permitted increases in exportable surpluses from this area. Euring 1952 the per-capita consumption of meat totaled 208 pounds for Australia and 220 pounds for New Zealand.

Per-Capita Consumption by Countries

The per capita consumption of meat continued during 1952 at a high level in those countries where meat production is well above domestic requirements and priced favorably with other foods. During 1952 per capita consumption exceeded 200 pounds in 4 countries - Uruguay, Argentina, New Zealand and Australia, ranging downward from 243 pounds in Uruguay to 208 pounds in Australia. Per capita consumption at a high level varies considerably from year to year in this group of countries.

I relatively high level of per capita consumption (144 to 100) pounds prevailed during 1952 in 5 countries. These countries in that order were the United States, Canada, Renmark, France and Sweden. The trend during recent years in per capita consumption has been downward in these countries except for France and Sweden.

The per capita consumption during 1952 ranged from 99 pounds to 50 pounds in 14 of the countries (mostly Muropean) included in the accompanying table. Generally, the available supplies of meat in these countries have increased during recent years at a rate substantially above population gains. The largest increase in supplies for this group has occurred in European countries as a result of an increase in meat production from an early postwar low. Even with some tendency towards a leveling off of production in some of these countries the available supplies for the group are likely to increase at a rate above population gains at least for another year or two.

Per capita consumption during 1952 continued below 50 pounds in 4 countries, Tortugal, Perico, Italy and Greece. The available meat supplies have increased during recent years at a rate exceeding population gains in only one of these countries, Italy.

Per Capita Consumption by Type of Meat

The total supplies of meat available for consumption in the specified countries during 1952 consisted of about 52 percent beef, 41 percent pork, and 7 percent mutton. These proportions and consequently the per capita consumption of the different types of meat vary greatly from country to country.

In Uruguay about 72 percent of the total per capita consumption of meat was beef in contrast to 63 percent as pork for Denmark. Beef accounts for a very large share of the total meat consumed per capita in 7 countries including Uruguay, Argentina, Brazil, Union of South Africa, Australia and New Lealand. In most of the remaining countries (except Denmark) beef and pork, combined on more of an equable basis, account for the larger share of meat consumed.

During 1952 the per capita consumption of pork was equal to or exceeded beef in 50 percent of the countries where comparable data were available; while pork exceeded beef in only 25 percent of these same countries during the 1946-50 period and 33 percent prior to forld ar II. This shift to larger supplies of pork has not been confined to European countries; a similar shift has also occurred during recent years in both the United States and Canada.
